

FORD IGNITION LOCKS

IMPORTANT: See the separate Ford Trucks section for Pickups, Vans, and heavy duty trucks. Sport Utility Vehicles such as Bronco, Escape, Explorer, Expedition, and Excursion are in this section.

General information as follows:

1. Key blank references are for the profile only, using one of the more well-known blank numbers. This list does not include all variations of different head shapes, lengths, or transponders, the main object is to identify which key profile enters the lock.
2. The dual part numbers for the same applications are the same part numbers at the same price. The number beginning with LC are Lockcraft part numbers. The ASP format part number (such as beginning with C-42-) are from the days when ASP sold only the original Ford production parts made by Hurd in Tennessee. The 10-cut Ford ignition locks now sold by ASP are those which are approved by Ford Motor Co. the same as previously produced by Hurd.
3. Items marked DWO are discontinued when out. The part numbers are listed for the benefit of those who already have stock.

			NOTE: C-42-197 replaces C-42-187. C-42-197 does not include the large black clip which fits onto the rear of the plug as used on some models. The retaining pin of C-42-197 cannot be depressed to remove the cylinder assembly from the steering column lock housing until the plug is turned. This is different from the C-42-187 design lock that the clip interlocks with the housing to prevent removing the cylinder without turning the cylinder. The clip from the lock being replaced may be installed on the back of the new C-42-197 lock, although because of the different retaining pin design the interlocking function of the clip is not important for security against unauthorized removal of the cylinder assembly from the lock housing.

Mustang	2005-14	H75	NOTE: C-42-197 replaces C-42-187. C-42-197 does not include the large black clip which fits onto the rear of the plug as used on some models. The retaining pin of C-42-197 cannot be depressed to remove the cylinder assembly from the steering column lock housing until the plug is turned. This is different from the C-42-187 design lock that the clip interlocks with the housing to prevent removing the cylinder without turning the cylinder. The clip from the lock being replaced may be installed on the back of the new C-42-197 lock, although because of the different retaining pin design the interlocking function of the clip is not important for security against unauthorized removal of the cylinder assembly from the lock housing.
